Release notes

Versions 23.10.A - 23.10.D

Date: 29 January 2024

This document contains the release notes for RED-V Server versions 23.10.A through 23.10.D.

Quick Summary (What's new)

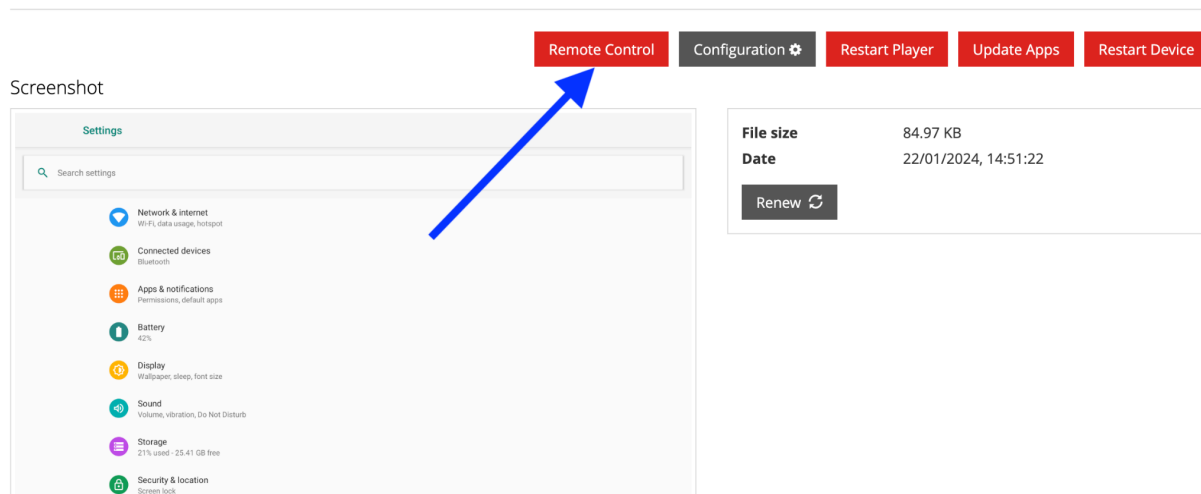

- New lightweight Basic Remote Control feature.
- Support for playlists in marquee text areas.
- WEBM video format now supported for uploads.
- New efficient positioning control for large playlists.

NEW FEATURES

Basic Remote Control

A new Basic Remote Control feature lets you interact with your devices using your mouse and keyboard—similar to tools like TeamViewer or AnyDesk. Instead of live video streaming, it uses a sequence of screenshots to show the remote screen.

This simple and lightweight solution allows you to access settings or perform basic actions on the device remotely.

Playlists of marquee texts

You can now assign a playlist to marquee areas, just like you already do with images or videos. This means you can schedule and organize scrolling text content — either horizontal or vertical — using playlists for better control and flexibility.

WEBM format Support

In addition, WEBM video format is now supported for upload. You can include WEBM files in your programs, expanding the range of media types you can use.

Please note: WEBM playback may not be supported on older media players.

Playlist ordering tool

A new control has been added to easily move items within a playlist by choosing the target position directly. This is especially useful for playlists with dozens of items, where moving an item across many positions (e.g., from position 5 to 72) would be impractical using drag and drop alone.
